## Course1 syllabus

Spring 2018

| Week | Topic  | Assignments (Homework and Lab)                        |
|------|--|---|
| 1    | Arithmetic expressions and functions,              |   |
|      | function signature and purpose statements,         |   |
|      | test cases   |   |
| 2    | Compound data (structures), data definitions,      | Helper functions (calculating profit), functions over |
|      | conditionals, helper functions                     | structures (Valentine's day gift data), conditionals  |
|      |  | (determining astronomical seasons)                    |
| 3    | Lists of atomic data, the design recipe            | Functions over lists of strings, functions over       |
|      |  | structures (course enrollment data), data             |
|      |  | definitions and test cases for lists of atomic data   |
| 4    | Lists of structures, helper functions for lists of | Functions over lists of structs                       |
|      | structures, binary trees                           |   |
| 5    | Binary search trees, N-ary trees                   | Binary search trees (taxpayer database)               |
| 6    | Higher-order functions: filter and map, local      | N-ary trees (river system)                            |
| 7    | Accumulators, mutable variables, mutation          | Map and filter, accumulators, mutable variables       |
| 8    | Mutation   | None (end of course)                                  |

## Course2 syllabus

Fall 2018

| Week | Topic   | Assignments   |
|------|---|---|
| 1    | Arithmetic expressions                                      |   |
| 2    | Booleans, conditionals, the design recipe                   | Functions and tests relating to numbers, images, and strings                                  |
| 3    | Structures  | Functions and tests relating to numbers, images, and strings; programs using conditional data |
| 4    | Unions, self-referential data definitions                   | designing data definitions, using structures; programs using structured data                  |
| 5    | Lists and designing functions on lists, lists of structures | Working with external libraries; functions over unions and self-referential data              |
| 6    | Abstractions  |   |
| 7    | Abstractions, scope and local                               | Functions over lists and compound data  |
| 8    | Design recipe for abstractions, programming with I/O        | Abstractions, map, filter, foldr  |
| 9    | Trees   | Processing large amounts of data using I/O; list-processing                                   |
| 10   | Graphs  | Processing tree-structured and mutually-recursive data  |
| 11   | Generative recursion  |   |
| 12   | Generative recursion  | Process graphs (network of people)  |
| 13   | Accumulators, lambda  | Generative recursion  |
| 14   | Lambda  | Designing with accumulators   |
